

Web Development in Three Steps

by OpenLibrary Sample Team

HTML for structure, CSS for style, JavaScript for behaviour.

Step 1: HTML gives structure

HTML describes what is on the page. Tags such as heading, paragraph and link tell the browser the role of each piece of content.

```
<h1>My first page</h1>  
<p>Hello, world!</p>
```

Think of HTML as the skeleton of a website.

Step 2: CSS gives style

CSS decides how the page looks: colours, fonts, spacing and layout.

```
h1 {  
  color: darkblue;  
  font-size: 2rem;  
}
```

A CSS rule has a selector (which element) and declarations (what to change).

Step 3: JavaScript gives behaviour

JavaScript makes the page react to people. It can change text, respond to clicks and talk to a database.

```
document.querySelector('h1').textContent = 'Hi!';
```

Start small: change one thing on the page, then build up.
